Abstract: The notion of a weakly symmetric and weakly projective symmetric Riemannian manifolds have been introduced by Tamassy and Binh [11],[12] and then after studied by so many authors such as De, Shaikh and Jana, Shaikh and Hui, Shaikh, Jana and Eyasmin ([1], [3], [4], [5], [6], [7], [8]). Recently, Singh and Khan [10] introduced the notion of Special weakly symmetric Riemannian manifolds and denoted such manifold by $(SWS)_n$. A.U. Khan and Q. Khan found some results On Special Weakly Projective Symmetric Manifolds [13]. And P. Verma, P. Kanaujia and S. Kishor found some results on M-Projective Curvature Tensor on (k, μ) - Contact Space Forms and Sasakian-Space-Forms ([16], [17]) . Motivated from the above, we have studied the nature of Ricci tensor R of type (1,1) in a special weakly M-projective symmetric Riemannian manifold $(SWS)_n$ and also explored some interesting results on $(SWS)_n$.

Keywords: M-projective curvature tensor, Curvature Tensor. Ricci tensor, Einstein manifold, Special weakly M-projective symmetric Riemannian manifold, Codazzi type.

1. Introduction

Let (M^n, g) be a Riemannian manifold of dimension n with the Riemannian metric g and $\zeta(M)$ denote the set of differentiable vector fields on M^n . Let $K(X, Y, Z)$ be the Riemannian curvature tensor of type (1,3) for $X, Y, Z \in \zeta(M)$. A non flat Riemannian manifold (M^n, g) , ($n \geq 2$) is called a special weakly symmetric Riemannian manifold, if its curvature tensor K of type (1,3) satisfies the following condition [10].

$$(D_X K)(Y, Z, V) = 2\alpha(X)K(Y, Z, V) + \alpha(Y)K(X, Z, V) \\ + \alpha(Z)K(Y, X, V) + \alpha(V)K(Y, Z, X), \quad (1.1)$$

where α is a non-zero 1-form and ρ is associated vector field such that

$$\alpha(X) = g(X, \rho) \quad (1.2)$$

for every vector field X and D denotes the operator of covariant differentiation with respect to the metric g . Such a manifold is denoted by $(SWS)_n$. In case, the 1-form α is zero, then $(SWS)_n$ becomes locally symmetric manifold [9]. If we replace K by \tilde{F} in (1.1), then it becomes

$$(D_X \tilde{F})(Y, Z, V) = 2\alpha(X)\tilde{F}(Y, Z, V) + \alpha(Y)\tilde{F}(X, Z, V) \\ + \alpha(Z)\tilde{F}(Y, X, V) + \alpha(V)\tilde{F}(Y, Z, X) \quad (1.3)$$

where \tilde{F} is the M-Projective curvature tensor defined by

$$\tilde{F}(Y, Z, V) = K(Y, Z, V) - \frac{1}{4n} \left[g(Z, V)QY - g(Y, V)QZ \right. \\ \left. + Ric(Z, V)Y - Ric(Y, V)Z \right] \quad (1.4)$$

Here Ric is the Ricci tensor of type (0,2). Such an n -dimensional Riemannian manifold shall be called a special weakly M-projective symmetric Riemannian manifold and such a manifold is denoted by $(SWMS)_n$.

If a Riemannian manifold is Einstein, then

$$Ric(X, Y) = \lambda g(X, Y) \quad (1.5)$$

where λ is constant. From (1.5), we have

$$R(X) = \lambda X, \quad (1.6)$$

where R is the Ricci tensor of type (1,1) and is defined by [2]

$$g(R(X), Y) = Ric(X, Y). \quad (1.7)$$

Contracting (1.6) with respect to X , we get

$$r = n\lambda \quad (1.8)$$

where r is a scalar curvature.

The above results will be used in the next section.

2. Existence of a $(SWMS)_n$

Let (M^n, g) be a $(SWMS)_n$. Taking covariant derivative of (1.4) with respect to X and then using (1.3), we get

$$\begin{aligned} & 2\alpha(X)\tilde{F}(Y, Z, V) + \alpha(Y)\tilde{F}(X, Z, V) + \alpha(Z)\tilde{F}(Y, X, V) + \alpha(V)\tilde{F}(Y, Z, X) \\ &= (D_X K)(Y, Z, V) - \frac{1}{4n} \left[(D_X Ric)(Z, V)Y - (D_X Ric)(Y, V)Z \right]. \end{aligned} \quad (2.1)$$

By virtue of (1.4), the relation (2.1) reduces to

$$\begin{aligned} & (D_X K)(Y, Z, V) - 2\alpha(X)K(Y, Z, V) - \alpha(Y)K(X, Z, V) - \alpha(Z)K(Y, X, V) \\ & - \alpha(V)K(Y, Z, X) - \frac{1}{(4n)} \left[(D_X Ric)(Z, V)Y - (D_X Ric)(Y, V)X \right. \\ & - 2\alpha(X) \left\{ g(Z, V)QY - g(Y, V)QZ + Ric(Z, V)Y - Ric(Y, V)Z \right\} \\ & - \alpha(Y) \left\{ g(Z, V)QX - g(X, V)QZ + Ric(Z, V)X - Ric(X, V)Z \right\} \\ & - \alpha(Z) \left\{ g(X, V)QY - g(Y, V)QX + Ric(X, V)Y - Ric(Y, V)X \right\} \\ & \left. - \alpha(V) \left\{ g(Z, X)QY - g(Y, X)QZ + Ric(Z, X)Y - Ric(Y, X)Z \right\} \right] = 0. \end{aligned} \quad (2.2)$$

Permuting equation (2.2) twice with respect to X, Y, Z ; and then adding the three obtained equations and using Bianchi's first and second identities; symmetric property of Ricci tensor and the skew-symmetric properties of curvature tensor, we get

$$\begin{aligned} & (D_X Ric)(Z, V)Y + (D_Y Ric)(X, V)Z + (D_Z Ric)(Y, V)X \\ & - (D_Y Ric)(Z, V)X - (D_Z Ric)(X, V)Y = 0. \end{aligned} \quad (2.3)$$

Theorem 2.1. *In a $(SWMS)_n$, the Ricci tensor of type (1,1) is of Codazzi type.*

Proof. Contracting (2.3) with respect to X , we get

$$(D_Z Ric)(Y, V) - (D_Y Ric)(Z, V) = 0 \quad (2.4)$$

Consequently in view of (1.7), the relation (2.4) gives

$$(D_Z R)(Y) - (D_Y R)(Z) = 0. \quad (2.5)$$

(2.5) shows that the Ricci tensor of type (1,1) is of Codazzi type. \square

Theorem 2.2. *In a $(SWMS)_n$, the scalar curvature r is constant.*

Proof. Contracting (2.5) with respect to Y , we get

$$Z r = 0$$

which shows that the scalar curvature r is constant. \square

Theorem 2.3. *The necessary and sufficient condition for an Einstein $(SWM S)_n$ to be a $(SWS)_n$ is that*

$$[2\alpha(X)QY + \lambda Y + \alpha(Y)QX + \lambda X]g(Z, V) - [2\alpha(X)QZ + \lambda Z + \alpha(Z)QX + \lambda X]g(Y, V) + [\alpha(Z)QY + \lambda Y - \alpha(Y)QZ - \lambda Z]g(X, V) + \alpha(V)[g(Z, X)QY - g(Y, X)QZ + \lambda g(Z, X)Y - \lambda g(Y, X)Z] = 0.$$

Proof. By virtue of (1.5), the equation (1.4) reduces to the form

$$\tilde{F}(Y, Z, V) = K(Y, Z, V) - \frac{1}{(4n)} \left[g(Z, V)QY - g(Y, V)QZ + \lambda \{g(Z, V)Y - g(Y, V)Z\} \right]. \quad (2.6)$$

Taking covariant derivative of (2.6) with respect to X , we get

$$(D_X \tilde{F})(Y, Z, V) = (D_X K)(Y, Z, V). \quad (2.7)$$

Using (1.3) in (2.7), we get

$$(D_X K)(Y, Z, V) = 2\alpha(X)\tilde{F}(Y, Z, V) + \alpha(Y)\tilde{F}(X, Z, V) + \alpha(Z)\tilde{F}(Y, X, V) + \alpha(V)\tilde{F}(Y, Z, X). \quad (2.8)$$

By virtue of (2.6), the relation (2.8) reduces to the form

$$\begin{aligned} (D_X K)(Y, Z, V) = & 2\alpha(X) \left[K(Y, Z, V) - \frac{1}{(4n)} \left\{ g(Z, V)QY - g(Y, V)QZ \right. \right. \\ & \left. \left. + \lambda \{g(Z, V)Y - g(Y, V)Z\} \right\} \right] + \alpha(Y) \left[K(X, Z, V) \right. \\ & \left. - \frac{1}{(4n)} \left\{ g(Z, V)QX - g(X, V)QZ + \lambda \{g(Z, V)X - g(X, V)Z\} \right\} \right] \\ & + \alpha(Z) \left[K(Y, X, V) - \frac{1}{(4n)} \left\{ g(X, V)QY - g(Y, V)QX \right. \right. \\ & \left. \left. + \lambda \{g(X, V)Y - g(Y, V)X\} \right\} \right] + \alpha(V) \left[K(Y, Z, X) \right. \\ & \left. - \frac{1}{(4n)} \left\{ g(Z, X)QY - g(Y, X)QZ + \lambda \{g(Z, X)Y - g(Y, X)Z\} \right\} \right]. \end{aligned} \quad (2.9)$$

This completes the proof. \square

3. Manifold satisfying $\tilde{F}(Y, Z, V) = 0$

Let (M^n, g) be a M-projectively flat, that is, $\tilde{F}(Y, Z, V) = 0$, then the relation (1.4) reduces to

$$K(Y, Z, V) = \frac{1}{4n} \left[g(Z, V)QY - g(Y, V)QZ + Ric(Z, V)Y - Ric(Y, V)Z \right]. \quad (3.1)$$

Taking covariant derivative of (3.1) with respect to X , we have

$$(D_X K)(Y, Z, V) = \frac{1}{4n} \left[(D_X Ric)(Z, V)Y - (D_X Ric)(Y, V)Z \right]. \quad (3.2)$$

Permuting equation (3.2) twice with respect to X, Y, Z ; and then adding the three obtained equations and using Bianchi's second identity, we have

$$\begin{aligned} & (D_X Ric)(Z, V)Y + (D_Y Ric)(X, V)Z + (D_Z Ric)(Y, V)X \\ & - (D_X Ric)(Y, V)Z - (D_Y Ric)(Z, V)X - (D_Z Ric)(X, V)Y = 0. \end{aligned} \quad (3.3)$$

Theorem 3.1. *In a M -projectively flat Riemannian manifold, the Ricci tensor R of type $(1,1)$ is of Codazzi type.*

Proof. Contracting (3.3) with respect to X , we have

$$(D_Z Ric)(Y, V) - (D_Y Ric)(Z, V) = 0. \quad (3.4)$$

Consequently in view of (1.7), the relation (3.4) gives

$$(D_Z R)(Y) - (D_Y R)(Z) = 0. \quad (3.5)$$

This completes the proof. \square

Definition 3.2. *An n -dimensional Riemannian manifold is called a special weakly Ricci symmetric manifold [10] if the Ricci tensor Ric of type $(0,2)$ satisfies the following condition:*

$$(D_X Ric)(Y, Z) = 2\alpha(X)Ric(Y, Z) + \alpha(Y)Ric(X, Z) + \alpha(Z)Ric(Y, X), \quad (3.6)$$

where α is a non-zero 1-form. Such a manifold is denoted by $(SWRS)_n$. Now using (3.6) in (3.3), we have

$$\begin{aligned} & \alpha(X)Ric(Z, V)Y + \alpha(Y)Ric(X, V)Z + \alpha(Z)Ric(Y, V)X \\ & - \alpha(X)Ric(Y, V)Z - \alpha(Y)Ric(Z, V)X - \alpha(Z)Ric(X, V)Y = 0. \end{aligned} \quad (3.7)$$

Theorem 3.3. *In a M -projectively flat $(SWRS)_n$, 1-form α is collinear with the Ricci tensor R .*

Proof. Contracting (3.7) with respect to X , we have

$$\alpha(Z)Ric(Y, V) - \alpha(Y)Ric(Z, V) = 0. \quad (3.8)$$

which in view of (1.7) gives

$$\alpha(Z)g(R(Y), V) - \alpha(Y)g(R(Z), V) = 0. \quad (3.9)$$

Consequently the above relation turns into

$$\alpha(Z)R(Y) - \alpha(Y)R(Z) = 0. \quad (3.10)$$

\square

Theorem 3.4. *In a $(SWM S)_n$, if a Riemannian manifold is a $(SWRS)_n$, the 1-form α is collinear with the Ricci tensor R . of type (1,1).*

Proof. Taking covariant derivative of (1.4) with respect to X , we have

$$(D_X \tilde{F})(Y, Z, V) = (D_X K)(Y, Z, V) - \frac{1}{4n} \left[(D_X Ric)(Z, V)Y - (D_X Ric)(Y, V)Z \right]. \quad (3.11)$$

Permutating equation (3.11) twice with respect to X, Y, Z ; and then adding the three obtained equations and using Bianchi's second identity, we have

$$\begin{aligned} & (D_X \tilde{F})(Y, Z, V) + (D_Y \tilde{F})(Z, X, V) + (D_Z \tilde{F})(X, Y, V) \\ &= -\frac{1}{4n} \left[(D_X Ric)(Z, V)Y - (D_X Ric)(Y, V)Z + (D_Y Ric)(X, V)Z \right. \\ & \quad \left. - (D_Y Ric)(Z, V)X + (D_Z Ric)(Y, V)X - (D_Z Ric)(X, V)Y \right]. \end{aligned} \quad (3.12)$$

Using (1.3) and (3.6) in and taking in mind the skew-symmetric of $\tilde{F}(X, Y, Z)$, cyclic property of $\tilde{F}(X, Y, Z)$ and symmetric property of Ricci tensor of type (0,2), we have

$$\begin{aligned} & \alpha(X)Ric(Z, V)Y - \alpha(X)Ric(Y, V)Z + \alpha(Y)Ric(X, V)Z \\ & - \alpha(Y)Ric(Z, V)X + \alpha(Z)Ric(Y, V)X - \alpha(Z)Ric(X, V)Y = 0 \end{aligned} \quad (3.13)$$

Contracting (3.13) with respect to X , we have

$$(n-2)\alpha(Z)Ric(Y, V) - (n-2)\alpha(Y)Ric(Z, V) = 0, \quad (3.14)$$

which in view of (1.7) the relation (3.14) gives

$$\alpha(Z)g(R(Y), V) - \alpha(Y)g(R(Z), V) = 0. \quad (3.15)$$

Consequently the relation (3.15) gives

$$\alpha(Z)R(Y) - \alpha(Y)R(Z) = 0. \quad (3.16)$$
